Presentation Abstract

Investing in People — The True Value of Talent Through Philosophy With AI

칼 베네딕트 프레이 영국 옥스퍼드대학교 교수 / 미래 일자리 프로그램 디렉터 **Carl Benedikt Frey** Dieter Schwarz Foundation Professor of Political Economy and Technology, University of Oxford

Artificial intelligence is reshaping work by changing not only which tasks are automated, but also who performs them and how work is divided between people and machines. It can enable new forms of self-service, allowing people to carry out tasks that were previously performed by others. It can also lower barriers to skilled work, making some skills and capabilities more accessible. At the same time, AI can create entirely new tasks and occupations, even as other tasks and occupations disappear. These changes are shifting the division of labour: the range of work undertaken by people and machines, and the way that work is allocated between them. As this division continues to change, the premium increasingly moves towards capabilities that machines struggle to replicate, including trust, judgment, creativity, and human interaction.
