Presentation Abstract

신 인재전쟁 新 人材戰爭 — 인간이 결정하는 시대
The New War for Talent: An Age Decided by Humans

조남준 싱가포르 난양공과대학교 재료공학과 교수 Cho Namjoon Professor, School of Materials Science and Engineering, Nanyang Technological University (NTU)

When AI can find, organize, and produce knowledge, the oldest function of universities, transmitting knowledge, loses its monopoly. Drawing on fourteen years at Nanyang Technological University, I argue that this is not the end of the university but a return to its original purpose: a place where society asks questions of itself. NTU grew into a top-ranked research university in under forty years through institutional design: researcher-centered fellowships, tenure criteria that value originality and societal impact over citation counts, corporate labs aligned with national R&D roadmaps, globally open recruitment of leadership, and dialogue platforms where Nobel laureates, students, and citizens pose shared questions. In the age of knowledge substitution, the university's irreplaceable value lies in deciding which questions are worth asking, cultivating people who cross disciplinary and national boundaries, and taking responsibility for answers. For Korean universities, the first reform is to ask themselves why they exist.
