Presentation Abstract

AI Cannot Solve a Productivity Problem You Have Not Defined

니나 요르덴 영국 케임브리지대학교 베넷 공공정책스쿨 교수 **Nina Jorden** Professor, Bennett School of Public Policy, University of Cambridge

AI cannot solve a productivity problem that an organisation has not defined. For managers, the real challenge is not simply where to deploy AI, but how to use it to strengthen the way the organisation creates value. This session will examine what successful AI implementation actually depends on. Drawing on the latest research, I will introduce conceptual frameworks that help executives understand how AI interacts with organisational productivity, work processes and capability development, and where different forms of automation and augmentation can create value. Particular attention will be given to the role of senior and middle managers in translating strategy into new ways of working while maintaining judgement, accountability and organisational learning. The central message is simple: AI creates value only when leaders understand the productivity system they are transforming—and make deliberate choices about how that system should evolve over time.
