Presentation Abstract

Resilient and Augmented: Vocational Training for Youth in the AI Economy

숀 도허티 보스턴칼리지 교육 및 정책학 교수 Shaun M. Dougherty Professor, Education & Policy, Boston College

Young people entering the AI economy face a compound challenge: degrees are common, entry-level work is thinning, and pathways into new fields are unclear. Drawing on causal studies of career and technical education (CTE) in Massachusetts and Connecticut, and on evidence that "college for all" overstated the average return to a degree, this talk asks what vocational education and training can offer. CTE raised graduation and earnings for some students, at reasonable cost. I argue it can serve youth in two ways: by preparing them for hands-on trades least exposed to immediate AI replacement, and by preparing them for AI-augmented technical roles in health, IT, and engineering, where gains may be larger but training is more intensive. I close with program design principles, first-job ladders, and equity implications.
